

LLMForge Technical Documentation

=====

Introduction:

LLMForge is an advanced platform designed to orchestrate, evaluate, and monitor complex LLM workflows in production environments. It provides deep observability into model behavior, latency, and costs.

Key Features:

1. A/B Prompt Testing: Evaluate prompt permutations against test cases.
2. Real-time Monitoring: View telemetry, latencies, and usage costs.
3. Heuristic Evaluations: Automated evaluation of model responses using RAGAS.

Architecture:

The frontend is built with React/Next.js and styled with Tailwind CSS v4.
The backend runs on FastAPI, using Supabase for telemetry storage.
